LEARNING DIARY, Front-End MODULE

LEARNING DIARY

Introduction and Base HTML

In the first I chose Visual Studio Code to be my editor, which was familiar from previous courses. VSC is also used in tutorial video, and I think it's the most suitable way to learn in this course's coursework.

Linking different fonts and where to find them were biggest learning point in the first section. Also how to link icon next to page name in and web browsers bar was interesting. Emmet abbreviation tool usage when writing code is also making life easier, making coding almost like magic.

Links and Core CSS

Interesting part when start to do CSS-file was to notice how navigation bar was built piece by piece and it worked perfectly. Previous navigation bars that I have been build has always been some issues but this way it worked out nicely. Specifying objects when building desktop version and mobile was new to me and make CSS more flexible when styling the website. Another good learning point were how to use variables in CSS, I haven't cross that before.

Buttons & Utility Classes

First interesting part of this part of tutorial video was how to handle last-child and handle with the icon in the button. Good to learn from this part of tutorial were how to add background image and change the CSS-styling to make it look good. Playing with contrasts in different part of the page is probably going more of graphical designer side, but I think it's a good learning point even for the programmer to have more of visual aspect of the webpages, what looks good and what look sketchy. It brings straight more professional feel for the website.

CSS Grid and Cards

First in my mind from this section, is the importance of different classes like "cards", is that you have always way to make everything look equal looking and design choices will follow all the way. When moving to grid part, first big lesson were the repeat-command, it gives

easy way to make grid looking well designed. Good learning point from the tutorial were that order in CSS-file is also important when handling background colors etc.. Last thing this part thought me well that every piece of html code can be decorated separately with CSS.

FAQ Elements

First thing to learn for me in this part of tutorial were, that it is important to not write typo's anywhere and matching every piece its exact location where it needs to be, otherwise styling won't match the part where it should be. World of Javascript, first thing I learned to be useful were e.target command when having eventlistener and how it captures the whole pieces of HTML parts. Useful and very cool way is from tutorial how to open and close parts in list using only few commands in Javascript file.

Mobile Menu & Responsiveness

First lesson for me was found out how to make burger-menu, giving it three div:s to create lines is new for me, I have previously used only icon to create to looks three lines aka burger. Decorating pages to be more useful in the mobile devices is also taking quite a lot to make page look professional. New thing to me was that horizontal scroll can be hidden. Biggest learning point were that measurements of the elements are not fixed in many places but using different percentual or other similar ways to match element sizes.

Course Project

Course project basic elements follow the tutorial project, but with the vision of its own. Multiple pages webpage instead of one main page. Course projects theme is inspired by Hoonigans famous Hoonipigasus-car which was driven by Ken Block. Page is built by basic elements and it has responsive styles. Mostly text by the project is Lorem Ipsum and really has no meaning, whole project point is just showcase elements and its responsiveness.
